

Pre-Fabricated Rotary / Turbine Meter Sets

Commercial and industrial users of rotary and turbine meter sets can put away their pipe cutting, threading, and beveling equipment. Kerotest now handles those jobs. And we do it in a controlled, clean environment that assures perfect fits, tight joints, API 1104 welds and 100% factoring testing. There is no rain, sleet, snow, dirt, mud or dead of night; just high quality components, precisely measured and perfectly assembled in our plant, then delivered to the job site.

All Kerotest meter sets are built to customer specifications featuring our complete line of proven, maintenance-free Weldball, Gate and Needle valves, and tee strainers. Our extensive inventory of these components means one-stop ordering and quick turnaround for our customers. Plus, our experienced staff follows the same TQM quality procedures during assembly, as they do during the manufacture of each Kerotest valve and component. So get your high quality meter sets, constructed of the highest quality materials and assembled by people who follow the highest quality standards in the industry.

Pre-fabricated meter sets improve the efficiency of customer operations by dramatically reducing assembly, installation and testing times. Kerotest even applies any customer-specified coating before shipping...eliminating the need to apply these coatings on the job site. Customers also enjoy the cost and time savings realized by eliminating field fabrication of meter sets. Installers no longer have to spend time sorting through pipe nipples and fittings to find the size and configuration they need. And factory pressure testing assures no leaks, eliminating costly rework. So, you get a higher quality product that installs more cost-efficiently.
